

Conservation Law Signal Under Adversarial Poisoning

$\alpha \cdot q \cdot V = \text{override_rate} \times \text{override_quality} \times \text{verified_per_day}$. Gate 3 blocks promotion when signal < $\theta_{\min}=0.467$.

Mean $\alpha \cdot q \cdot V$ trajectory across 20 seeds. Malicious analysts inflate α but zero q (override_quality=0) $\rightarrow \alpha \cdot q$ product drops. Dotted vertical = mean G3 trigger; dash-dot = mean accuracy drop.
