

Subtle Poisoning: Gate Detection vs Inflation Level

Subtle attacker inflates **ONLY** acceptance signal for v4 (weight=0.4). Other metrics (res, time, correct, overrides) are genuine.

v4 Promotion Rate
(Attacker target, quality=0.55)

Gate Blocking Breakdown
(% of all v4 block events per gate)

$N=30$ seeds $\times$ 1000 decisions. $\theta_{\min}=0.467$, $\Delta_{\min}=0.03$. Dashed = P4-POWER crude-attacker reference (total quality inflation). Expected $\alpha \cdot q \cdot V$ (F/G) = 0.422 ($\theta_{\min}=0.467$).
