

Gate 1 Detection Power: N vs Inflation
 $P(\text{promote} \mid \text{data}) > 80\%$ via Beta posterior normal approximation. $\Delta_{\min}=0.05$, $P_{\text{thresh}}=0.95$.

$N_{\text{seeds}}=200$ per cell. Baseline quality=0.7. N split equally between variants. Blue contour = 80% power boundary. Col 0pp = false positive rate (should be $<5\%$).
