

THE LINKEDIN ALGORITHM

Why your posts don't get the reach they deserve

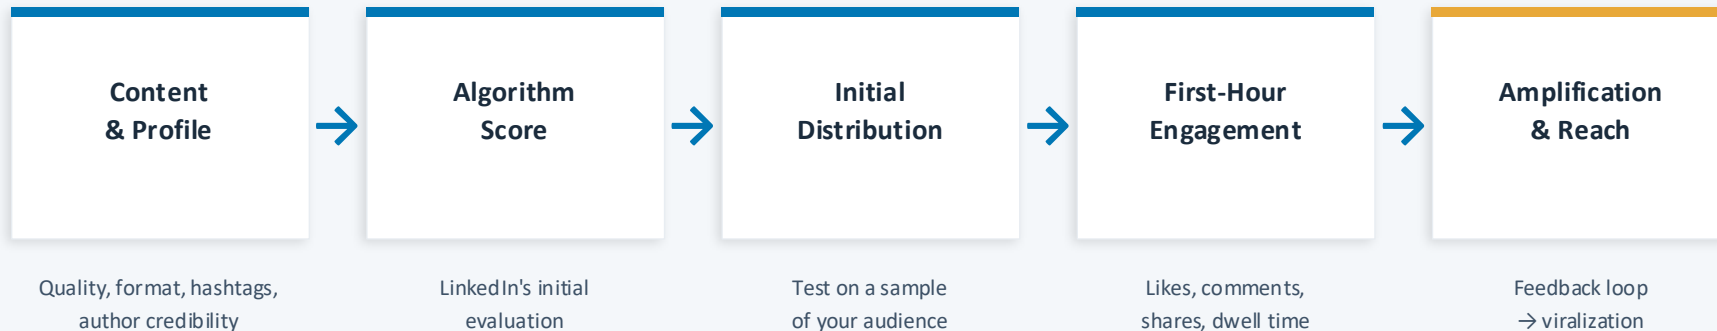

What a causal Bayesian network reveals

The Causal Bayesian Network

It's not the content that determines reach.

It's a causal chain.

Reach is not a direct result of content quality.

It's the output of a feedback loop system you can influence at every stage.

The signal LinkedIn values most

5 to 10x

The weight of a comment
vs a like in the algorithm

But comments only appear
when 3 conditions are met:

A relevant topic

Aligned with your audience's interests

The right timing

Tue-Thu morning for an active audience

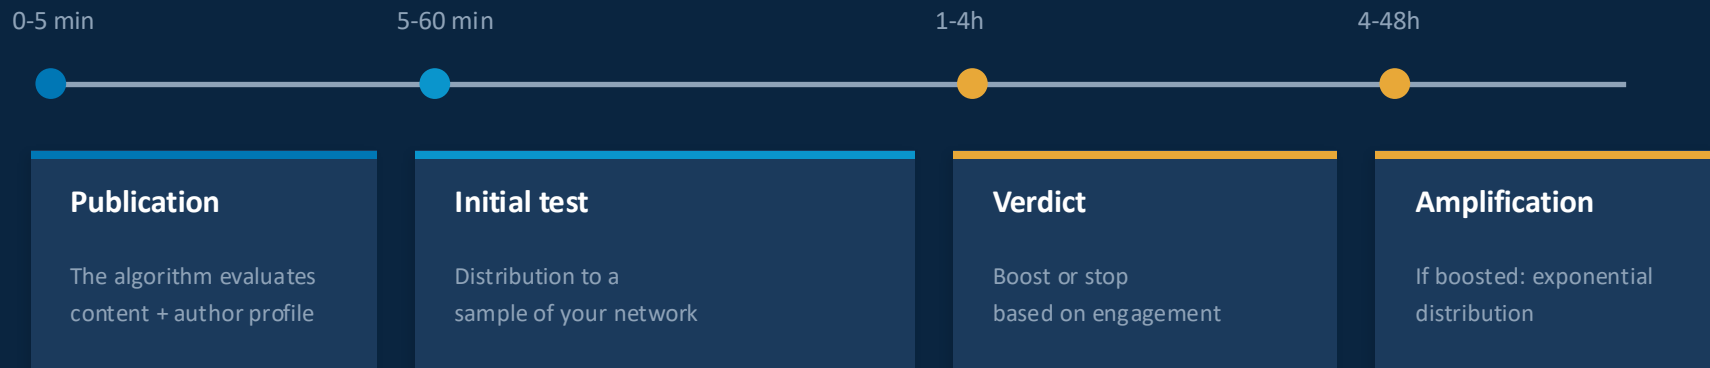

Stimulating content

That sparks reflection, debate, or sharing

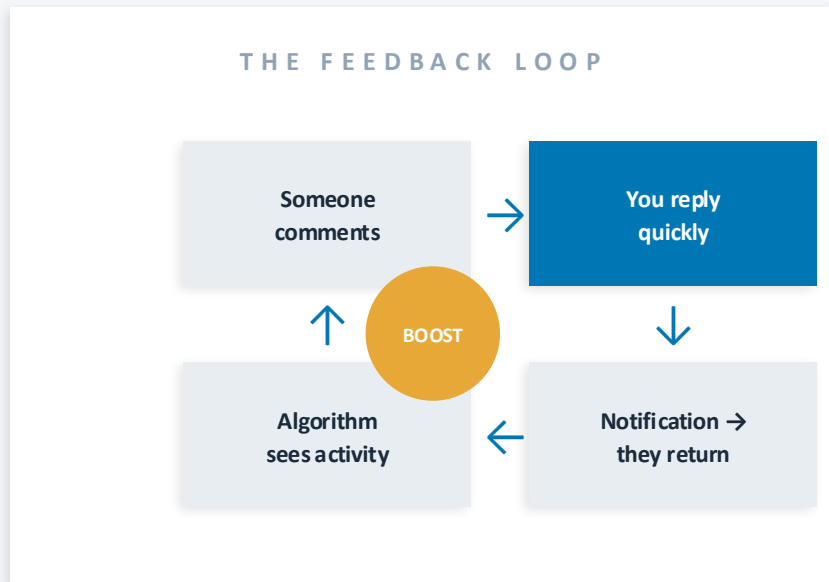

*Likes are a weak signal. Only comments trigger
massive redistribution by the algorithm.*

The first hour is decisive

*If engagement doesn't come within the first hour,
the algorithm drastically reduces distribution. The post is "buried."*

The detail that changes everything

Replying quickly to comments isn't just good manners.

It's an algorithmic lever.

Each reply generates a notification that brings the commenter back. The algorithm interprets this activity as a signal that the content is "alive" and relaunches distribution.

Fast, quality replies can turn an average post into a viral one.

You don't publish a post.

You trigger a system.

01

**Craft your content
and visual format**

Carousel > Plain text

02

**Publish at the right time
on the right topic**

Tue-Thu morning, relevant topic

03

**Be present
the first hour**

Reply fast and well

*Have you figured out what really makes
the difference in your posts' reach?*
