

Bridge B Diagnostic: G_4/G_1 Convergence Acceleration by Threshold and Initial Error
Floor-proximity hypothesis: reduction increases as ϵ decreases (threat_intel $e_{\text{inf}} \approx 0.0499 \approx \epsilon=0.05$)

soc_product_v50 ($C=6, A=4, d=6$). $\eta=0.05, \rho=0.8, N_{\text{EFF}}=1.111$. G_4 applies $\text{threat_intel} \times 0.70 + \text{base}/N_{\text{EFF}}$. 30 seeds $\times 6C \times 4A = 720$ cells. Blue box = P2 operating point.
