

Bridge B Diagnostic: Per-Factor Enrichment Effect at P2 Operating Point ($\epsilon=0.05$, $e_0=0.15$)

Per-Factor Enrichment Effect
($\epsilon=0.05$, $e_0=0.15$ — P2 operating point)

G₁ vs G₄ N_converge per Factor
(1D simulation, single-factor isolation)

1D per-factor simulation: 2000 max decisions, $N=1000$ cells, $\mu_{\text{true}}=0.5$, $\eta=0.05$, $\epsilon=0.05$, $e_0=0.15$. G4 applies threat_intel_enrichment variance $\times 0.70$. Purple bar = G4-targeted factor.
