

Bridge B Phase C v2: Effective Learning Rate vs Endogenous Graph Enrichment

$\eta_{\text{eff}} = 1 - \exp(\text{log-linear slope})$ per 500-decision window. R^2 shown above each bar.

soc_product_v50 (C=6, A=4, d=6). 50 seeds. If η_{eff} increases as noise decreases: simulation evidence consistent with $\gamma > 1$. Enrichment rates are environment-specific estimates.
