

Breach Window vs Signal Level

$W = -\ln(\delta) \cdot R^2 / (2\epsilon^2)$ [Hoeffding], $W = \text{Var} / (\delta \cdot \epsilon^2)$ [Chebyshev]. $\delta=0.05$, $\theta_{\min}=0.434$, $R=39.254$.

Signal = $\alpha \cdot q \cdot V_{\text{day}}$. $\alpha \sim \text{Beta}(6.0, 14.0)$, $q \sim \text{Beta}(16.0, 4.0)$, $V \sim \text{Poisson}(60/\text{day})$. Range $R=39.254$ from 50×90 simulation. Log y-axis. Engineering choice $W=14$ shown as dash-dot green line.
